

BICYCLE PEDAL

ABSTRACT OF THE DISCLOSURE

A bicycle pedal includes a pedal body that rotates about a pedal shaft and a pair of clamping members coupled to opposite ends of the pedal body. Preferably, the both clamping members are preferably pivotally coupled to the pedal body. The bicycle pedal also has at least one pedal body cover. In the preferred embodiment, the pedal body cover has a protective body portion and a pair of attachment legs. The protective body portion is configured and dimensioned to overlie an area located along a center section of a pedal body of the bicycle pedal. The attachment legs extend from the protective body portion, and are configured and dimensioned relative to the protective body portion to be retained to the pedal body of the bicycle pedal by the pivot pin that pivotally couples the clamping members to the pedal body.
